

Test Summary Report

Project Information

Project Name: E-Commerce Website QA Portfolio Project

Tester: Josh Williams

Testing Type: Manual Functional Testing

Test Environment: Windows 11 Google Chrome (Latest Version)

Testing Period: June 2026

Objective

The objective of this project was to evaluate the functionality, usability, and reliability of a simulated e-commerce web application through manual testing.

Testing focused on core user workflows including authentication, product search, shopping cart management, and checkout functionality.

Scope of Testing

The following modules were included in testing:

Login Module

Coverage Included:

- Successful Login
- Invalid Login Attempts
- Password Validation
- Account Lockout
- Password Reset
- Session Timeout
- Logout Functionality
- Protected Page Access

Test Cases Executed: 15

Search Module

Coverage Included:

- Existing Product Search
- Non-Existing Product Search
- Partial Keyword Search
- Empty Search Validation
- Special Character Search
- Search Result Relevance

Test Cases Executed: 6

Shopping Cart Module

Coverage Included:

- Add Product to Cart
- Remove Product from Cart
- Update Quantity
- Multiple Product Management
- Cart Persistence
- Quantity Validation

Test Cases Executed: 6

Checkout Module

Coverage Included:

- Successful Checkout
- Missing Shipping Information
- Invalid Payment Information
- Order Confirmation Validation
- Checkout Cancellation

Test Cases Executed: 5

Test Execution Summary

Metric	Count
Total Test Cases Created	32
Total Modules Tested	4
Total Defects Identified	5
High Severity Defects	4
Medium Severity Defects	1

Defect Summary

BUG_001

Cart total does not update when product quantity changes.

Severity: High

Status: Open

BUG_002

User can submit checkout without required shipping address.

Severity: High

Status: Open

BUG_003

Cart total does not recalculate after quantity update.

Severity: High

Status: Open

BUG_004

User remains authenticated after logout and can access protected pages.

Severity: High

Status: Open

BUG_005

Relevant search results are not returned for exact product searches.

Severity: Medium

Status: Open

Testing Techniques Applied

The following QA methodologies were utilized:

- Functional Testing
 - Negative Testing
 - Validation Testing
 - Boundary Value Testing
 - Authentication Testing
 - Authorization Testing
 - Session Management Testing
 - Search Relevance Testing
 - Defect Reporting
-

Risks Identified

The following high-risk issues were identified during testing:

1. Users can access protected resources after logout.
2. Orders can be submitted without required shipping information.
3. Cart calculations may produce inaccurate totals.
4. Search functionality may fail to return relevant products.

These issues could negatively impact user experience, business operations, and system security.

Conclusion

Testing successfully validated core e-commerce workflows and identified several defects affecting security, checkout validation, search functionality, and shopping cart calculations.

A total of 32 test cases were created across four major application modules and five defects were documented using industry-standard defect reporting practices.

This project demonstrates practical experience in manual software testing, test case design, defect identification, defect documentation, and QA process execution.
